

## ABSTRACT OF THE DISCLOSURE

[045] A golf ball including a composition having an unsaturated polymer, a cross-linking agent, and a peptizer, wherein the cross-linking agent is present in less than about 0.45 part by weight per 100 parts by weight of the unsaturated polymer. The composition can be incorporated into the golf ball's core, intermediate layers, and cover layers, and can provide optimal performance and durability properties. The golf balls incorporating the composition are easy to manufacture.
